```
-Question
Hints
Solution
3. Questions
#----#
Question 1
Level 1
Question:
Write a program which will find all such numbers which are divisible
by 7 but are not a multiple of 5,
between 2000 and 3200 (both included).
The numbers obtained should be printed in a comma-separated sequence
on a single line.
Hints:
Consider use range(#begin, #end) method
Solution:
1=[]
for i in range (2000, 3201):
   if (i\%7==0) and (i\%5!=0):
       l.append(str(i))
```

```
print ','.join(l)
#----#
#----#
Question 2
Level 1
Question:
Write a program which can compute the factorial of a given numbers.
The results should be printed in a comma-separated sequence on a
single line.
Suppose the following input is supplied to the program:
8
Then, the output should be:
40320
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
def fact(x):
   if x == 0:
       return 1
   return x * fact(x - 1)
x=int(raw input())
print fact(x)
```

```
#----#
Question 3
Level 1
Question:
With a given integral number n, write a program to generate a
dictionary that contains (i, i*i) such that is an integral number
between 1 and n (both included). and then the program should print the
dictionary.
Suppose the following input is supplied to the program:
8
Then, the output should be:
{1: 1, 2: 4, 3: 9, 4: 16, 5: 25, 6: 36, 7: 49, 8: 64}
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Consider use dict()
Solution:
n=int(raw input())
d=dict()
for i in range(1,n+1):
   d[i]=i*i
print d
#----#
```

Question:

Write a program which accepts a sequence of comma-separated numbers from console and generate a list and a tuple which contains every number.

Suppose the following input is supplied to the program:

34,67,55,33,12,98

Then, the output should be:

```
['34', '67', '55', '33', '12', '98']
('34', '67', '55', '33', '12', '98')
```

Hints:

In case of input data being supplied to the question, it should be assumed to be a console input.

tuple() method can convert list to tuple

```
Solution:
```

```
values=raw_input()
l=values.split'
t=tuple(1)
```

print 1

print t

#----#

#----#C

Question 5

Level 1

```
Define a class which has at least two methods:
getString: to get a string from console input
printString: to print the string in upper case.
Also please include simple test function to test the class methods.
Hints:
Use init method to construct some parameters
Solution:
class InputOutString(object):
   def init (self):
       self.s = ""
   def getString(self):
       self.s = raw input()
   def printString(self):
       print self.s.upper()
strObj = InputOutString()
strObj.getString()
strObj.printString()
#----#
#----#
Question 6
```

Level 2

```
Question:
```

Write a program that calculates and prints the value according to the given formula:

```
Q = Square root of [(2 * C * D)/H]
```

Following are the fixed values of C and H:

C is 50. H is 30.

D is the variable whose values should be input to your program in a comma-separated sequence.

Example

Let us assume the following comma separated input sequence is given to the program:

100,150,180

The output of the program should be:

18,22,24

Hints:

If the output received is in decimal form, it should be rounded off to its nearest value (for example, if the output received is 26.0, it should be printed as 26)

In case of input data being supplied to the question, it should be assumed to be a console input.

Solution:

```
#!/usr/bin/env python
import math
c=50
h=30
value = []
items=[x for x in raw_input().split(',')]
for d in items:
    value.append(str(int(round(math.sqrt(2*c*float(d)/h)))))
```

```
print ','.join(value)
#----#
#----#
Question 7
Level 2
Question:
Write a program which takes 2 digits, X,Y as input and generates a 2-
dimensional array. The element value in the i-th row and j-th column
of the array should be i*j.
Note: i=0,1..., X-1; j=0,1,;Y-1.
Example
Suppose the following inputs are given to the program:
3,5
Then, the output of the program should be:
[[0, 0, 0, 0, 0], [0, 1, 2, 3, 4], [0, 2, 4, 6, 8]]
Hints:
Note: In case of input data being supplied to the question, it should
be assumed to be a console input in a comma-separated form.
Solution:
input str = raw input()
dimensions=[int(x) for x in input str.split(',')]
rowNum=dimensions[0]
colNum=dimensions[1]
multilist = [[0 for col in range(colNum)] for row in range(rowNum)]
```

```
for col in range (colNum):
       multilist[row][col] = row*col
print multilist
#----#
#----#
Question 8
Level 2
Question:
Write a program that accepts a comma separated sequence of words as
input and prints the words in a comma-separated sequence after sorting
them alphabetically.
Suppose the following input is supplied to the program:
without, hello, bag, world
Then, the output should be:
bag, hello, without, world
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
items=[x for x in raw input().split(',')]
items.sort()
print ','.join(items)
```

```
Question 9
Level 2
Question£°
Write a program that accepts sequence of lines as input and prints the
lines after making all characters in the sentence capitalized.
Suppose the following input is supplied to the program:
Hello world
Practice makes perfect
Then, the output should be:
HELLO WORLD
PRACTICE MAKES PERFECT
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
lines = []
while True:
    s = raw input()
    if s:
        lines.append(s.upper())
    else:
        break;
for sentence in lines:
   print sentence
```

```
#-----#
Question 10
Level 2
Ouestion:
Write a program that accepts a sequence of whitespace separated words
as input and prints the words after removing all duplicate words and
sorting them alphanumerically.
Suppose the following input is supplied to the program:
hello world and practice makes perfect and hello world again
Then, the output should be:
again and hello makes perfect practice world
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
We use set container to remove duplicated data automatically and then
use sorted() to sort the data.
Solution:
s = raw input()
words = [word for word in s.split(" ")]
print " ".join(sorted(list(set(words))))
#----#
#----#
Question 11
Level 2
```

```
Write a program which accepts a sequence of comma separated 4 digit
binary numbers as its input and then check whether they are divisible
by 5 or not. The numbers that are divisible by 5 are to be printed in
a comma separated sequence.
Example:
0100,0011,1010,1001
Then the output should be:
1010
Notes: Assume the data is input by console.
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
value = []
items=[x for x in raw input().split(',')]
for p in items:
    intp = int(p, 2)
    if not intp%5:
        value.append(p)
```

```
print ','.join(value)
#----#
#-----#
Question 12
```

Question:

Level 2

Write a program, which will find all such numbers between 1000 and 3000 (both included) such that each digit of the number is an even number.

The numbers obtained should be printed in a comma-separated sequence on a single line.

Hints:

In case of input data being supplied to the question, it should be assumed to be a console input.

Solution: values = [] for i in range(1000, 3001): s = str(i) if (int(s[0])%2==0) and (int(s[1])%2==0) and (int(s[2])%2==0) and (int(s[3])%2==0): values.append(s) print ",".join(values) #------# Question 13 Level 2

Question:

Write a program that accepts a sentence and calculate the number of letters and digits.

Suppose the following input is supplied to the program:

hello world! 123

Then, the output should be:

LETTERS 10

```
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
s = raw input()
d={"DIGITS":0, "LETTERS":0}
for c in s:
   if c.isdigit():
       d["DIGITS"]+=1
   elif c.isalpha():
       d["LETTERS"]+=1
   else:
       pass
print "LETTERS", d["LETTERS"]
print "DIGITS", d["DIGITS"]
#----#
#-----#
Question 14
Level 2
Question:
Write a program that accepts a sentence and calculate the number of
upper case letters and lower case letters.
Suppose the following input is supplied to the program:
```

Hello world!

Then, the output should be:

```
UPPER CASE 1
LOWER CASE 9
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
s = raw input()
d={"UPPER CASE":0, "LOWER CASE":0}
for c in s:
   if c.isupper():
       d["UPPER CASE"]+=1
   elif c.islower():
       d["LOWER CASE"]+=1
   else:
       pass
print "UPPER CASE", d["UPPER CASE"]
print "LOWER CASE", d["LOWER CASE"]
#----#
#----#
Question 15
Level 2
Question:
Write a program that computes the value of a+aa+aaa+aaaa with a given
digit as the value of a.
```

Suppose the following input is supplied to the program:

```
Then, the output should be:
11106
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
a = raw input()
n1 = int( "%s" % a )
n2 = int( "%s%s" % (a,a) )
n3 = int( "%s%s%s" % (a,a,a) )
n4 = int( "%s%s%s%s" % (a,a,a,a) )
print n1+n2+n3+n4
#----#
#----#
Ouestion 16
Level 2
Question:
Use a list comprehension to square each odd number in a list. The list
is input by a sequence of comma-separated numbers.
Suppose the following input is supplied to the program:
1,2,3,4,5,6,7,8,9
Then, the output should be:
1,3,5,7,9
```

Hints:

In case of input data being supplied to the question, it should be assumed to be a console input. Solution: values = raw input() numbers = [x for x in values.split(",") if int(x) %2!=0]print ",".join(numbers) #----# Question 17 Level 2 Question: Write a program that computes the net amount of a bank account based a transaction log from console input. The transaction log format is shown as following: D 100 W 200 D means deposit while W means withdrawal. Suppose the following input is supplied to the program: D 300 D 300 W 200 D 100 Then, the output should be:

Hints:

500

In case of input data being supplied to the question, it should be

```
Solution:
netAmount = 0
while True:
   s = raw_input()
   if not s:
       break
   values = s.split(" ")
   operation = values[0]
   amount = int(values[1])
   if operation == "D":
       netAmount+=amount
   elif operation=="W":
       netAmount-=amount
   else:
       pass
print netAmount
#----#
#-----#
Question 18
Level 3
Question:
A website requires the users to input username and password to
register. Write a program to check the validity of password input by
users.
Following are the criteria for checking the password:
```

1. At least 1 letter between [a-z]

```
2. At least 1 number between [0-9]
1. At least 1 letter between [A-Z]
3. At least 1 character from [$#@]
4. Minimum length of transaction password: 6
5. Maximum length of transaction password: 12
Your program should accept a sequence of comma separated passwords and
will check them according to the above criteria. Passwords that match
the criteria are to be printed, each separated by a comma.
Example
If the following passwords are given as input to the program:
ABd1234@1,a F1#,2w3E*,2We3345
Then, the output of the program should be:
ABd1234@1
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solutions:
import re
value = []
items=[x for x in raw input().split(',')]
for p in items:
    if len(p) < 6 or len(p) > 12:
        continue
    else:
        pass
    if not re.search("[a-z]",p):
        continue
```

elif not re.search("[0-9]",p):

```
continue
   elif not re.search("[A-Z]",p):
       continue
   elif not re.search("[$\#@]",p):
       continue
   elif re.search("\s",p):
       continue
   else:
       pass
   value.append(p)
print ",".join(value)
#-----#
#----#
Question 19
Level 3
Ouestion:
You are required to write a program to sort the (name, age, height)
tuples by ascending order where name is string, age and height are
numbers. The tuples are input by console. The sort criteria is:
1: Sort based on name;
2: Then sort based on age;
3: Then sort by score.
The priority is that name > age > score.
If the following tuples are given as input to the program:
Tom, 19,80
John, 20, 90
```

Jony, 17, 91

```
Json, 21, 85
Then, the output of the program should be:
[('John', '20', '90'), ('Jony', '17', '91'), ('Jony', '17', '93'),
('Json', '21', '85'), ('Tom', '19', '80')]
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
We use itemgetter to enable multiple sort keys.
Solutions:
from operator import itemgetter, attrgetter
1 = []
while True:
   s = raw input()
   if not s:
       break
   l.append(tuple(s.split(",")))
print sorted(1, key=itemgetter(0,1,2))
#----#
#----#
Question 20
Level 3
```

Define a class with a generator which can iterate the numbers, which

Question:

```
Hints:
Consider use yield
Solution:
def putNumbers(n):
   i = 0
   while i<n:
       j=i
       i=i+1
       if j %7 == 0:
          yield j
for i in reverse (100):
   print i
#----#
#----#
Question 21
Level 3
Question£°
A robot moves in a plane starting from the original point (0,0). The
robot can move toward UP, DOWN, LEFT and RIGHT with a given steps. The
trace of robot movement is shown as the following:
UP 5
DOWN 3
LEFT 3
```

RIGHT 2

```
i
The numbers after the direction are steps. Please write a program to
compute the distance from current position after a sequence of
movement and original point. If the distance is a float, then just
print the nearest integer.
Example:
If the following tuples are given as input to the program:
UP 5
DOWN 3
LEFT 3
RIGHT 2
Then, the output of the program should be:
2
Hints:
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
import math
pos = [0, 0]
while True:
    s = raw input()
    if not s:
        break
    movement = s.split(" ")
    direction = movement[0]
    steps = int(movement[1])
    if direction == "UP":
```

pos[0]+=steps

```
pos[0]-=steps
   elif direction=="LEFT":
       pos[1]-=steps
   elif direction=="RIGHT":
       pos[1]+=steps
   else:
       pass
print int(round(math.sqrt(pos[1]**2+pos[0]**2)))
#----#
Question 22
Level 3
Question:
Write a program to compute the frequency of the words from the input.
The output should output after sorting the key alphanumerically.
Suppose the following input is supplied to the program:
New to Python or choosing between Python 2 and Python 3? Read Python 2
or Python 3.
Then, the output should be:
2:2
3.:1
3?:1
New:1
Python:5
Read:1
```

and:1

```
between:1
choosing:1
or:2
to:1
Hints
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
freq = {} # frequency of words in text
line = raw input()
for word in line.split():
   freq[word] = freq.get(word, 0) +1
words = freq.keys()
words.sort()
for w in words:
   print "%s:%d" % (w,freq[w])
#-----#
Question 23
level 1
Question:
```

Write a method which can calculate square value of number

```
Hints:
   Using the ** operator
Solution:
def square(num):
   return num ** 2
print square(2)
print square(3)
#----#
#----#
Question 24
Level 1
Question:
   Python has many built-in functions, and if you do not know how to
use it, you can read document online or find some books. But Python
has a built-in document function for every built-in functions.
   Please write a program to print some Python built-in functions
documents, such as abs(), int(), raw input()
   And add document for your own function
Hints:
   The built-in document method is doc
Solution:
print abs. doc
print int. doc
```

print raw input. doc

```
def square(num):
   '''Return the square value of the input number.
   The input number must be integer.
   1 1 1
   return num ** 2
print square(2)
print square. doc
#----#
#----#
Question 25
Level 1
Question:
   Define a class, which have a class parameter and have a same
instance parameter.
Hints:
   Define a instance parameter, need add it in __init__ method
   You can init a object with construct parameter or set the value
later
Solution:
class Person:
   # Define the class parameter "name"
   name = "Person"
```

```
# self.name is the instance parameter
       self.name = name
jeffrey = Person("Jeffrey")
print "%s name is %s" % (Person.name, jeffrey.name)
nico = Person()
nico.name = "Nico"
print "%s name is %s" % (Person.name, nico.name)
#----#
Question:
Define a function which can compute the sum of two numbers.
Hints:
Define a function with two numbers as arguments. You can compute the
sum in the function and return the value.
Solution
def SumFunction(number1, number2):
       return number1+number2
print SumFunction(1,2)
```

def init (self, name = None):

Question:

```
it in console.
Hints:
Use str() to convert a number to string.
Solution
def printValue(n):
       print str(n)
printValue(3)
#----#
Question:
Define a function that can convert a integer into a string and print
it in console.
Hints:
Use str() to convert a number to string.
Solution
def printValue(n):
       print str(n)
printValue(3)
```

Question:

Define a function that can receive two integral numbers in string form and compute their sum and then print it in console.

Hints:

Use int() to convert a string to integer.

Solution

def printValue(s1,s2):

print int(s1)+int(s2)

printValue("3","4") #7

#----#

2.10

Question:

Define a function that can accept two strings as input and concatenate them and then print it in console.

Hints:

Use + to concatenate the strings

```
def printValue(s1,s2):
       print s1+s2
printValue("3","4") #34
#----#
2.10
Question:
Define a function that can accept two strings as input and print the
string with maximum length in console. If two strings have the same
length, then the function should print al 1 strings line by line.
Hints:
Use len() function to get the length of a string
Solution
def printValue(s1,s2):
       len1 = len(s1)
       len2 = len(s2)
       if len1>len2:
               print s1
       elif len2>len1:
               print s2
       else:
              print s1
```

print s2

```
printValue("one", "three")
2.10
Question:
Define a function that can accept an integer number as input and print
the "It is an even number" if the number is even, otherwise print "It
is an odd number".
Hints:
Use % operator to check if a number is even or odd.
Solution
def checkValue(n):
        if n%2 == 0:
                print "It is an even number"
        else:
                print "It is an odd number"
```

checkValue(7)

Question:

Define a function which can print a dictionary where the keys are numbers between 1 and 3 (both included) and the values are square of keys.

Hints:

Use dict[key]=value pattern to put entry into a dictionary.

Use ** operator to get power of a number.

Solution

def printDict():

d=dict()

d[1]=1

d[2]=2**2

d[3]=3**2

print d

printDict()

#----:

Question: Define a function which can print a dictionary where the keys are numbers between 1 and 20 (both included) and the values are square of keys. Hints: Use dict[key]=value pattern to put entry into a dictionary. Use ** operator to get power of a number. Use range() for loops. Solution def printDict(): d=dict() for i in range (1,21): d[i]=i**2 print d printDict()

2.10

Question:

Define a function which can generate a dictionary where the keys are numbers between 1 and 20 (both included) and the values are square of keys. The function should just print the values only.

#-----#

```
Use dict[key]=value pattern to put entry into a dictionary.
Use ** operator to get power of a number.
Use range() for loops.
Use keys() to iterate keys in the dictionary. Also we can use item()
to get key/value pairs.
Solution
def printDict():
       d=dict()
       for i in range (1,21):
               d[i]=i**2
       for (k, v) in d.items():
               print v
printDict()
#-----#
2.10
Question:
Define a function which can generate a dictionary where the keys are
numbers between 1 and 20 (both included) and the values are square of
```

keys. The function should just print the keys only.

Hints:

Hints:

```
Use ** operator to get power of a number.
Use range() for loops.
Use keys() to iterate keys in the dictionary. Also we can use item()
to get key/value pairs.
Solution
def printDict():
        d=dict()
        for i in range(1,21):
                d[i]=i**2
        for k in d.keys():
                print k
printDict()
2.10
Question:
Define a function which can generate and print a list where the values
are square of numbers between 1 and 20 (both included).
Hints:
Use ** operator to get power of a number.
Use range() for loops.
```

Use list.append() to add values into a list.

```
Solution
def printList():
       li=list()
       for i in range (1,21):
               li.append(i**2)
       print li
printList()
#----#
2.10
Question:
Define a function which can generate a list where the values are
square of numbers between 1 and 20 (both included). Then the function
needs to print the first 5 elements in the list.
Hints:
Use ** operator to get power of a number.
Use range() for loops.
Use list.append() to add values into a list.
Use [n1:n2] to slice a list
Solution
def printList():
```

li=list()

```
print li[:5]
printList()
#----#
2.10
Question:
Define a function which can generate a list where the values are
square of numbers between 1 and 20 (both included). Then the function
needs to print the last 5 elements in the list.
Hints:
Use ** operator to get power of a number.
Use range() for loops.
Use list.append() to add values into a list.
Use [n1:n2] to slice a list
Solution
def printList():
       li=list()
       for i in range (1,21):
               li.append(i**2)
```

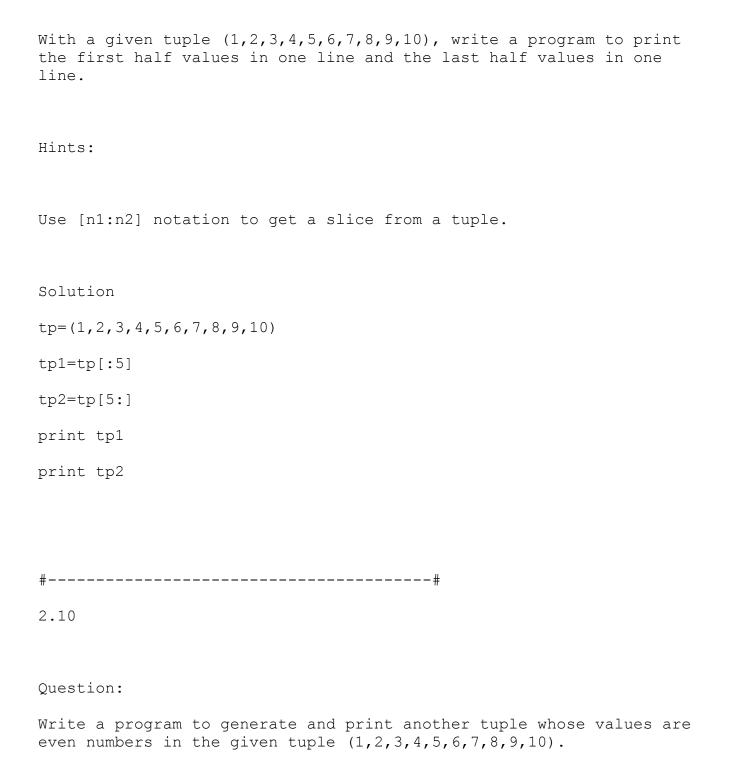

li.append(i**2)

print li[-5:]

```
printList()
2.10
Question:
Define a function which can generate a list where the values are
square of numbers between 1 and 20 (both included). Then the function
needs to print all values except the first 5 elements in the list.
Hints:
Use ** operator to get power of a number.
Use range() for loops.
Use list.append() to add values into a list.
Use [n1:n2] to slice a list
Solution
def printList():
        li=list()
        for i in range (1,21):
                li.append(i**2)
        print li[5:]
```

```
2.10
Question:
Define a function which can generate and print a tuple where the value
are square of numbers between 1 and 20 (both included).
Hints:
Use ** operator to get power of a number.
Use range() for loops.
Use list.append() to add values into a list.
Use tuple() to get a tuple from a list.
Solution
def printTuple():
        li=list()
        for i in range (1,21):
                li.append(i**2)
        print tuple(li)
printTuple()
```

#----#

Hints:

Use "for" to iterate the tuple

Use tuple() to generate a tuple from a list.

Solution

```
li=list()
for i in tp:
        if tp[i]%2==0:
                li.append(tp[i])
tp2=tuple(li)
print tp2
2.14
Question:
Write a program which accepts a string as input to print "Yes" if the
string is "yes" or "YES" or "Yes", otherwise print "No".
Hints:
Use if statement to judge condition.
Solution
s= raw input()
if s=="yes" or s=="YES" or s=="Yes":
   print "Yes"
else:
    print "No"
```

3.4 Question: Write a program which can filter even numbers in a list by using filter function. The list is: [1,2,3,4,5,6,7,8,9,10]. Hints: Use filter() to filter some elements in a list. Use lambda to define anonymous functions. Solution li = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]evenNumbers = filter(lambda x: x%2==0, li) print evenNumbers #----# 3.4 Question: Write a program which can map() to make a list whose elements are square of elements in [1,2,3,4,5,6,7,8,9,10]. Hints:

Use map() to generate a list.

Use lambda to define anonymous functions.

```
Solution
li = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
squaredNumbers = map(lambda x: x^{**2}, li)
print squaredNumbers
#----#
3.5
Question:
Write a program which can map() and filter() to make a list whose
elements are square of even number in [1,2,3,4,5,6,7,8,9,10].
Hints:
Use map() to generate a list.
Use filter() to filter elements of a list.
Use lambda to define anonymous functions.
Solution
li = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
evenNumbers = map(lambda x: x**2, filter(lambda x: x%2==0, li))
print evenNumbers
```

#------

Question:

Write a program which can filter() to make a list whose elements are even number between 1 and 20 (both included).

Hints:

Use filter() to filter elements of a list.

Use lambda to define anonymous functions.

Solution

evenNumbers = filter(lambda x: x%2==0, range(1,21))

print evenNumbers

#-----#

3.5

Question:

Write a program which can map() to make a list whose elements are square of numbers between 1 and 20 (both included).

Hints:

Use map() to generate a list.

Use lambda to define anonymous functions.

Solution

```
#-----#
7.2
Question:
Define a class named American which has a static method called
printNationality.
Hints:
Use @staticmethod decorator to define class static method.
Solution
class American(object):
   @staticmethod
   def printNationality():
       print "America"
anAmerican = American()
anAmerican.printNationality()
American.printNationality()
```

print squaredNumbers

```
7.2
Question:
Define a class named American and its subclass NewYorker.
Hints:
Use class Subclass (ParentClass) to define a subclass.
Solution:
class American(object):
    pass
class NewYorker(American):
    pass
anAmerican = American()
aNewYorker = NewYorker()
print anAmerican
print aNewYorker
```

#------

```
Question:
```

Define a class named Circle which can be constructed by a radius. The Circle class has a method which can compute the area.

```
Hints:
```

Use def methodName(self) to define a method.

Solution:

```
class Circle(object):
    def __init__(self, r):
        self.radius = r

    def area(self):
        return self.radius**2*3.14

aCircle = Circle(2)
print aCircle.area()
```

```
7.2
Define a class named Rectangle which can be constructed by a length
and width. The Rectangle class has a method which can compute the
Hints:
Use def methodName(self) to define a method.
Solution:
class Rectangle(object):
    def init (self, l, w):
        self.length = 1
        self.width = w
    def area(self):
        return self.length*self.width
aRectangle = Rectangle(2,10)
print aRectangle.area()
```

#----#

Define a class named Shape and its subclass Square. The Square class has an init function which takes a length as argument. Both classes have a area function which can print the area of the shape where Shape's area is 0 by default.

```
Hints:
```

To override a method in super class, we can define a method with the same name in the super class.

```
class Shape(object):
    def __init__(self):
        pass

    def area(self):
        return 0

class Square(Shape):
    def __init__(self, 1):
        Shape.__init__(self)
        self.length = 1
```

def area(self):

aSquare= Square(3)

return self.length*self.length

```
Use try/except to catch exceptions.
Solution:
def throws():
   return 5/0
try:
   throws()
except ZeroDivisionError:
   print "division by zero!"
except Exception, err:
   print 'Caught an exception'
finally:
   print 'In finally block for cleanup'
#----#
Define a custom exception class which takes a string message as
attribute.
Hints:
To define a custom exception, we need to define a class inherited from
Exception.
```

Solution:

```
"""My own exception class
    Attributes:
        msq -- explanation of the error
    11 11 11
    def init (self, msg):
        self.msg = msg
error = MyError("something wrong")
Question:
Assuming that we have some email addresses in the
"username@companyname.com" format, please write program to print the
user name of a given email address. Both user names and company names
are composed of letters only.
Example:
If the following email address is given as input to the program:
john@google.com
Then, the output of the program should be:
john
```

In case of input data being supplied to the question, it should be

assumed to be a console input.

```
Hints:
Use \w to match letters.
Solution:
import re
emailAddress = raw input()
pat2 = "(\w+)@((\w+\.)+(com))"
r2 = re.match(pat2,emailAddress)
print r2.group(1)
#----#
Question:
Assuming that we have some email addresses in the
"username@companyname.com" format, please write program to print the
company name of a given email address. Both user names and company
names are composed of letters only.
Example:
If the following email address is given as input to the program:
john@google.com
Then, the output of the program should be:
```

google

```
['2', '3']
In case of input data being supplied to the question, it should be
assumed to be a console input.
Hints:
Use re.findall() to find all substring using regex.
Solution:
import re
s = raw input()
print re.findall("\d+",s)
#----#
Question:
Print a unicode string "hello world".
Hints:
Use u'strings' format to define unicode string.
Solution:
```

unicodeString = u"hello world!"

```
#----#
Write a program to read an ASCII string and to convert it to a unicode
string encoded by utf-8.
Hints:
Use unicode() function to convert.
Solution:
s = raw input()
u = unicode(s,"utf-8")
print u
#----#
Question:
Write a special comment to indicate a Python source code file is in
unicode.
Hints:
Solution:
# -*- coding: utf-8 -*-
#----#
```

Question:

```
Write a program to compute 1/2+2/3+3/4+...+n/n+1 with a given n input
by console (n>0).
Example:
If the following n is given as input to the program:
5
Then, the output of the program should be:
3.55
In case of input data being supplied to the question, it should be
assumed to be a console input.
Hints:
Use float() to convert an integer to a float
Solution:
n=int(raw input())
sum=0.0
for i in range(1,n+1):
    sum += float(float(i)/(i+1))
print sum
```

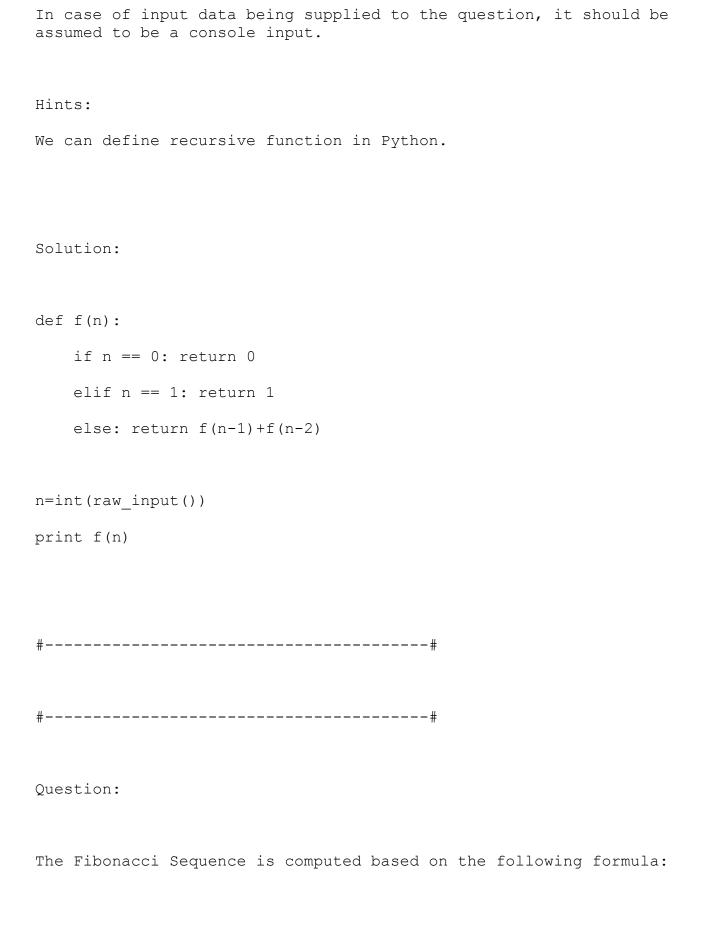

```
Write a program to compute:
f(n) = f(n-1) + 100 when n>0
and f(0)=1
with a given n input by console (n>0).
Example:
If the following n is given as input to the program:
5
Then, the output of the program should be:
500
In case of input data being supplied to the question, it should be
assumed to be a console input.
Hints:
We can define recursive function in Python.
Solution:
def f(n):
    if n==0:
```

return 0

return f(n-1)+100

n=int(raw input()) print f(n) #-----# Question: The Fibonacci Sequence is computed based on the following formula: f(n)=0 if n=0f(n)=1 if n=1f(n) = f(n-1) + f(n-2) if n>1Please write a program to compute the value of f(n) with a given n input by console. Example: If the following n is given as input to the program: 7

Then, the output of the program should be:

```
f(n) = f(n-1) + f(n-2) if n > 1
```

Please write a program using list comprehension to print the Fibonacci Sequence in comma separated form with a given n input by console.

Example:

If the following n is given as input to the program:

7

Then, the output of the program should be:

0,1,1,2,3,5,8,13

Hints:

We can define recursive function in Python.

Use list comprehension to generate a list from an existing list.

Use string.join() to join a list of strings.

In case of input data being supplied to the question, it should be assumed to be a console input.

Solution:

def f(n):

if n == 0: return 0

elif n == 1: return 1

else: return f(n-1)+f(n-2)

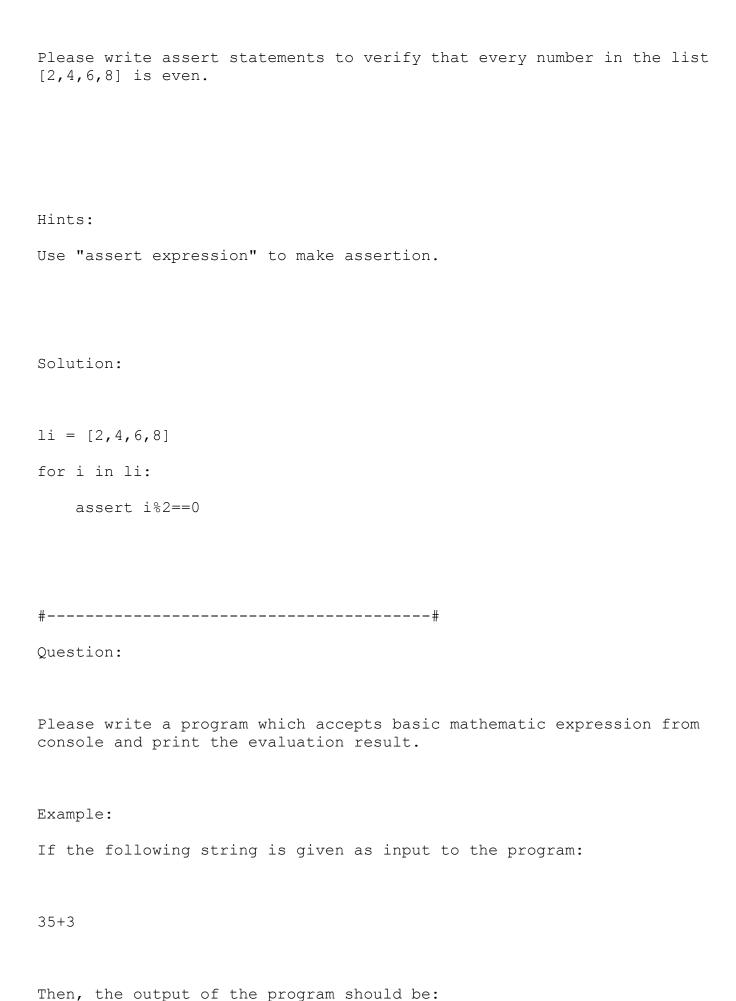

```
n=int(raw input())
values = [str(f(x)) for x in range(0, n+1)]
print ",".join(values)
Question:
Please write a program using generator to print the even numbers
between 0 and n in comma separated form while n is input by console.
Example:
If the following n is given as input to the program:
10
Then, the output of the program should be:
0,2,4,6,8,10
Hints:
Use yield to produce the next value in generator.
In case of input data being supplied to the question, it should be
assumed to be a console input.
```

Solution:

```
def EvenGenerator(n):
   i=0
   while i<=n:
       if i%2==0:
           yield i
       i+=1
n=int(raw_input())
values = []
for i in EvenGenerator(n):
   values.append(str(i))
print ",".join(values)
#-----#
Question:
Please write a program using generator to print the numbers which can
be divisible by 5 and 7 between 0 and n in comma separated form while
n is input by console.
Example:
If the following n is given as input to the program:
```

```
Then, the output of the program should be:
0,35,70
Hints:
Use yield to produce the next value in generator.
In case of input data being supplied to the question, it should be
assumed to be a console input.
Solution:
def NumGenerator(n):
   for i in range(n+1):
       if i\%5==0 and i\%7==0:
           yield i
n=int(raw input())
values = []
for i in NumGenerator(n):
   values.append(str(i))
print ",".join(values)
#----#
```

Question:

bottom = 0

```
Hints:
Use eval() to evaluate an expression.
Solution:
expression = raw_input()
print eval(expression)
#----#
Question:
Please write a binary search function which searches an item in a
sorted list. The function should return the index of element to be
searched in the list.
Hints:
Use if/elif to deal with conditions.
Solution:
import math
def bin search(li, element):
```

```
top = len(li)-1
    index = -1
    while top>=bottom and index==-1:
        mid = int(math.floor((top+bottom)/2.0))
        if li[mid] == element:
            index = mid
        elif li[mid]>element:
            top = mid-1
        else:
            bottom = mid+1
    return index
li=[2,5,7,9,11,17,222]
print bin search(li,11)
print bin search(li,12)
```

#----#

Question:

Please write a binary search function which searches an item in a sorted list. The function should return the index of element to be searched in the list.

Hints:

```
import math
def bin_search(li, element):
    bottom = 0
    top = len(li)-1
    index = -1
    while top>=bottom and index==-1:
        mid = int(math.floor((top+bottom)/2.0))
        if li[mid] == element:
            index = mid
        elif li[mid]>element:
            top = mid-1
        else:
            bottom = mid+1
    return index
li=[2,5,7,9,11,17,222]
print bin search(li,11)
print bin search(li,12)
```

Solution:

#-----

Question:
Please generate a random float where the value is between 10 and 100 using Python math module.
Hints:
Use random.random() to generate a random float in [0,1].
Solution:
import random
<pre>print random.random()*100</pre>
##
Question:
Please generate a random float where the value is between 5 and 95 using Python math module.
Hints:
Use random.random() to generate a random float in [0,1].

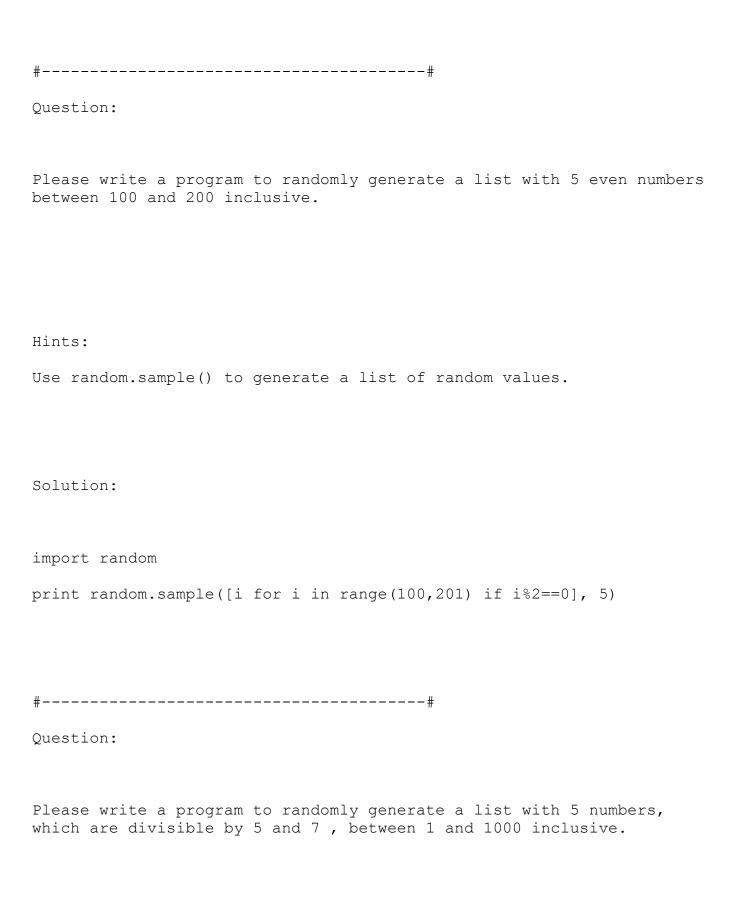

Solution:

import random
<pre>print random.random()*100-5</pre>
##
Question:
Please write a program to output a random even number between 0 and 10 inclusive using random module and list comprehension.
Hints:
Use random.choice() to a random element from a list.
Solution:
import random
<pre>print random.choice([i for i in range(11) if i%2==0])</pre>
##
Question:

Please write a program to output a random number, which is divisible by 5 and 7, between 0 and 10 inclusive using random module and list comprehension.

Hints:
Use random.choice() to a random element from a list.
Solution:
import random
print random.choice([i for i in range(201) if i%5==0 and i%7==0])
##
Question:
Please write a program to generate a list with 5 random numbers between 100 and 200 inclusive.
Hints:
Use random.sample() to generate a list of random values.
Solution:

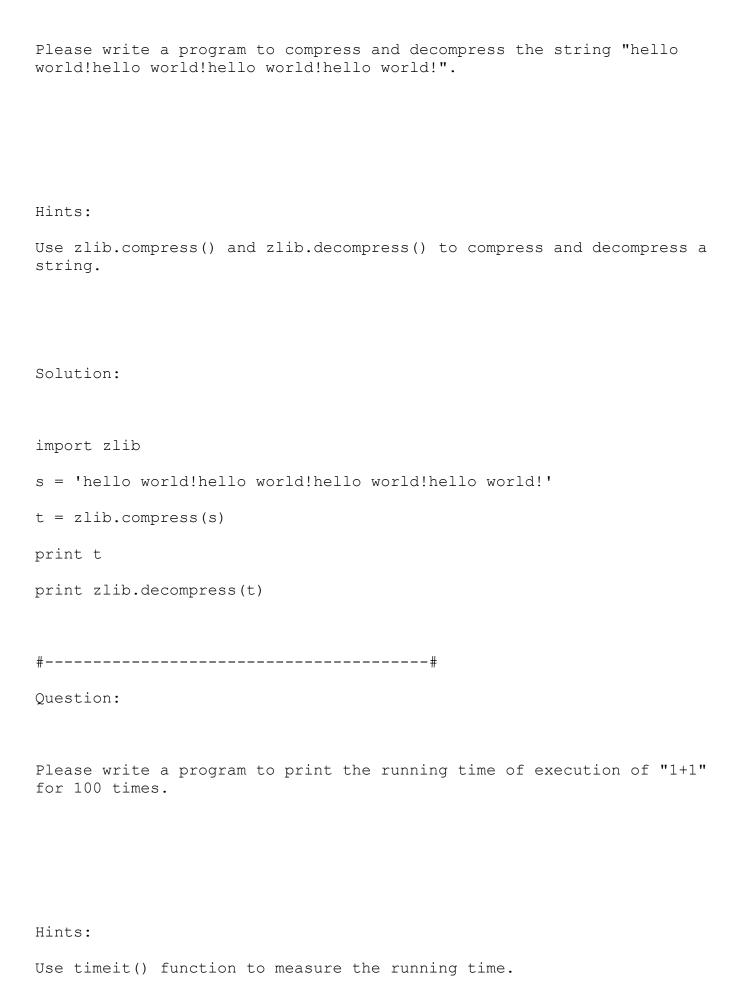

import random

Hints:

Use random.sample() to generate a list of random values.

```
from timeit import Timer
t = Timer("for i in range(100):1+1")
print t.timeit()
#----#
Question:
Please write a program to shuffle and print the list [3,6,7,8].
Hints:
Use shuffle() function to shuffle a list.
Solution:
from random import shuffle
1i = [3, 6, 7, 8]
shuffle(li)
print li
#----#
Question:
```

Please write a program to shuffle and print the list [3,6,7,8].

```
Hints:
Use shuffle() function to shuffle a list.
Solution:
from random import shuffle
li = [3, 6, 7, 8]
shuffle(li)
print li
#----#
Question:
Please write a program to generate all sentences where subject is in
["I", "You"] and verb is in ["Play", "Love"] and the object is in
["Hockey", "Football"].
Hints:
Use list[index] notation to get a element from a list.
Solution:
subjects=["I", "You"]
verbs=["Play", "Love"]
objects=["Hockey","Football"]
for i in range(len(subjects)):
```

```
for k in range(len(objects)):
           sentence = "%s %s %s." % (subjects[i], verbs[j],
objects[k])
           print sentence
Please write a program to print the list after removing delete even
numbers in [5,6,77,45,22,12,24].
Hints:
Use list comprehension to delete a bunch of element from a list.
Solution:
1i = [5, 6, 77, 45, 22, 12, 24]
li = [x for x in li if x%2!=0]
print li
#----#
Question:
By using list comprehension, please write a program to print the list
after removing delete numbers which are divisible by 5 and 7 in
[12,24,35,70,88,120,155].
Hints:
```

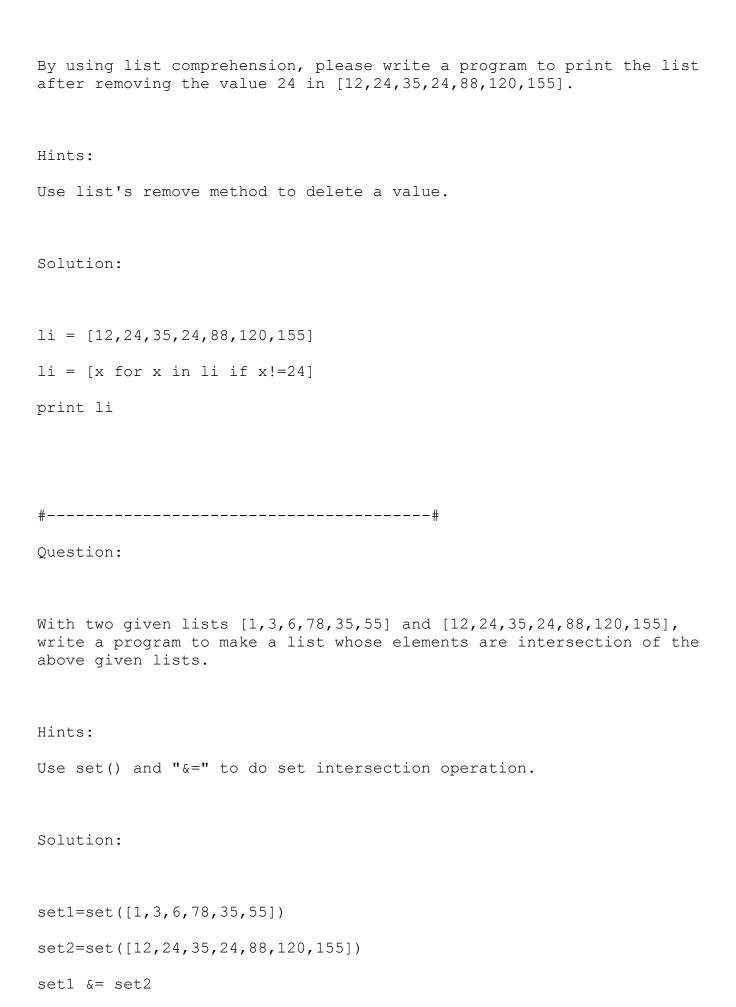

Use list comprehension to delete a bunch of element from a list.

Solution:

```
1i = [12, 24, 35, 70, 88, 120, 155]
li = [x \text{ for } x \text{ in } li \text{ if } x\%5!=0 \text{ and } x\%7!=0]
print li
Question:
By using list comprehension, please write a program to print the list
after removing the 0th, 2nd, 4th,6th numbers in
[12,24,35,70,88,120,155].
Hints:
Use list comprehension to delete a bunch of element from a list.
Use enumerate() to get (index, value) tuple.
Solution:
1i = [12, 24, 35, 70, 88, 120, 155]
li = [x \text{ for } (i,x) \text{ in enumerate}(li) \text{ if } i\%2!=0]
print li
#----#
Question:
```

By using list comprehension, please write a program generate a 3*5*8 3D array whose each element is 0.

```
Hints:
Use list comprehension to make an array.
Solution:
array = [[ [0 for col in range(8)] for col in range(5)] for row in
range(3)]
print array
#----#
Question:
By using list comprehension, please write a program to print the list
after removing the 0th, 4th, 5th numbers in [12,24,35,70,88,120,155].
Hints:
Use list comprehension to delete a bunch of element from a list.
Use enumerate() to get (index, value) tuple.
Solution:
1i = [12, 24, 35, 70, 88, 120, 155]
li = [x \text{ for } (i,x) \text{ in enumerate}(li) \text{ if i not in } (0,4,5)]
print li
```

```
print li
#-----#
With a given list [12,24,35,24,88,120,155,88,120,155], write a program
to print this list after removing all duplicate values with original
order reserved.
Hints:
Use set() to store a number of values without duplicate.
Solution:
def removeDuplicate( li ):
   newli=[]
   seen = set()
   for item in li:
       if item not in seen:
           seen.add( item )
           newli.append(item)
   return newli
li=[12,24,35,24,88,120,155,88,120,155]
print removeDuplicate(li)
```

Question:

Define a class Person and its two child classes: Male and Female. All classes have a method "getGender" which can print "Male" for Male class and "Female" for Female class.

```
Hints:
Use Subclass (Parentclass) to define a child class.
Solution:
class Person(object):
    def getGender( self ):
        return "Unknown"
class Male( Person ):
    def getGender( self ):
        return "Male"
class Female( Person ):
    def getGender( self ):
        return "Female"
aMale = Male()
aFemale = Female()
print aMale.getGender()
print aFemale.getGender()
```

Question: Please write a program which count and print the numbers of each character in a string input by console. Example: If the following string is given as input to the program: abcdefgabc Then, the output of the program should be: a,2 c,2 b,2 e,1 d,1 g,1 f,1 Hints: Use dict to store key/value pairs. Use dict.get() method to lookup a key with default value. Solution: $dic = {}$

s=raw input()

```
dic[s] = dic.get(s, 0) + 1
print '\n'.join(['%s,%s' % (k, v) for k, v in dic.items()])
#----#
Question:
Please write a program which accepts a string from console and print
it in reverse order.
Example:
If the following string is given as input to the program:
rise to vote sir
Then, the output of the program should be:
ris etov ot esir
Hints:
Use list[::-1] to iterate a list in a reverse order.
Solution:
s=raw input()
s = s[::-1]
print s
```

```
Question:
Please write a program which accepts a string from console and print
the characters that have even indexes.
Example:
If the following string is given as input to the program:
H1e2l3l4o5w6o7r8l9d
Then, the output of the program should be:
Helloworld
Hints:
Use list[::2] to iterate a list by step 2.
Solution:
s=raw input()
s = s[::2]
print s
#----#
```

Question:

```
Hints:
Use itertools.permutations() to get permutations of list.
Solution:
import itertools
print list(itertools.permutations([1,2,3]))
Question:
Write a program to solve a classic ancient Chinese puzzle:
We count 35 heads and 94 legs among the chickens and rabbits in a
farm. How many rabbits and how many chickens do we have?
Hint:
Use for loop to iterate all possible solutions.
Solution:
def solve(numheads, numlegs):
    ns='No solutions!'
    for i in range(numheads+1):
        j=numheads-i
        if 2*i+4*j==numlegs:
```

return i,j

```
numheads=35
numlegs=94
solutions=solve(numheads,numlegs)
print solutions
#-----#
```
